

# Paired component contributions across five seeds

Individual seed  
 42 123 456 789 1024

Difference = model after arrow minus control before arrow, paired within seed and identical cohort.  
 Diamonds and horizontal whiskers: mean  $\pm$  sample SD (ddof=1). Colors: individual seeds; vertical offsets only prevent overlap.  
 Fixed, previously observed splits; SD reflects training stochasticity, not dataset uncertainty. No significance claims.
